Fruit harvest – first fruit on
the main shoot reaches
typical harvest size and shape

The ideal conditions for foliar spraying are an air temperature of 12–20°C, relative humidity of 60–80%, and a spray solution temperature of 15–20°C. Spraying should be carried out in the early morning or evening. It is essential to strictly adhere to the recommended application rate and concentration for each product individually, taking into account the prevailing weather conditions.
